Title and Abstract

Title: Tingkat Kesadaran Pasien Dan Kelangka Yang Berasal (ang Di-RSPW) Hilang Selama Pandemi Covid-19

Abstract: Increased anxiety is a common mental health problem during Covid-19. Anxiety can cause symptoms of insomnia, poor concentration, irritability, reduced productivity, interpersonal conflict, stigma, and fear of re-infection in vulnerable groups. The purpose of this study was to identify the anxiety level of patients and families who were treated at RSPW Hilang Selama Pandemi Hilang during the pandemic Covid-19. This type of research is descriptive with a cross-sectional approach. The study population was all patients and their families who were treated at RSPW Hilang during Covid-19, with a total sampling technique of 20 people. The research variable is the level of anxiety. The instrument used was a questionnaire containing the general identity of the respondent, including the respondent's name, age, gender, and education. The anxiety level instrument was the WHO-5 Wellbeing Rating Scale. The anxiety which consists of 24 question items. Data were analyzed descriptively and presented in a percentage table. The results of the study showed that 70% of respondents had a moderate level of anxiety. Further research is suggested to study other factors related to anxiety in patients and families in the hospital.
